# CS 344 Assignment 1

## September 19, 2018

Name: Yang Bao NetID: yb184 Section: 02

The classmate I discussed with :  $\operatorname{Zitian}$   $\operatorname{Qin}$ 

### Problem 1:

- 1. f(n) = O(g(n))
- 2. f(n) = O(g(n))
- 3.  $f(n) = \Omega(g(n))$
- 4.  $f(n) = \Theta(g(n))$
- $5. \ f(n) = O(g(n))$
- 6. f(n) = O(g(n))
- 7.  $f(n) = \Omega(g(n))$
- 8. f(n) = O(g(n))
- 9.  $f(n) = \Theta(g(n))$
- $10. \ f(n) = O(g(n))$

#### Problem 2:

Part 1:

Sol:

1. Base part:

When 
$$k = 0$$
,  $\sum_{i=0}^{k} i2^{i} = 0$ .  
When  $k = 0$ ,  $(k-1) \cdot 2^{k+1} + 2 = 0$ .

When 
$$k = 0$$
,  $(k-1) \cdot 2^{k+1} + 2 = 0$ 

$$\sum_{i=0}^{k} i 2^{i} = (k-1) \cdot 2^{k+1} + 2$$

2. Induction part:

When 
$$k = k + 1$$
,  $\sum_{i=0}^{k+1} i2^i = \sum_{i=0}^k i2^i + (k+1)2^{k+1}$ 

As when 
$$k = k$$
,  $\sum_{i=0}^{k} i2^i = (k-1) \cdot 2^{k+1} + 2$ 

When 
$$\mathbf{k} = \mathbf{k} + 1$$
,  $\sum_{i=0}^{k+1} i 2^i = \sum_{i=0}^k i 2^i + (k+1)2^{k+1}$   
As when  $\mathbf{k} = \mathbf{k}$ ,  $\sum_{i=0}^k i 2^i = (k-1) \cdot 2^{k+1} + 2$ ,  $\sum_{i=0}^{k+1} i 2^i = (k-1) \cdot 2^{k+1} + 2 + (k+1) \cdot 2^{k+1} = 2k \cdot 2^{k+1} + 2 = k \cdot 2^{k+2} + 2$ 

When 
$$k = k + 1, (k - 1) \cdot 2^{k+1} + 2 = (k + 1 - 1) \cdot 2^{k+1+1} + 2 = k \cdot 2^{k+2} + 2$$

$$\sum_{i=0}^{k} i2^{i} = (k-1) \cdot 2^{k+1} + 2$$
 proved.

#### Part 2:

Sol:

First, 
$$\sum_{i=1}^{n} \frac{i^4}{10} \le \sum_{i=1}^{n} \frac{n^4}{10} = \frac{n^5}{10} \le n^5$$
. So  $\sum_{i=1}^{n} \frac{i^4}{10} = O(n^5)$   
Then to prove  $\sum_{i=1}^{n} \frac{i^4}{10} = \Omega(n^5)$   
Consider the last  $\frac{n}{2}$  numbers: 
$$\sum_{i=\frac{n}{2}}^{n} \frac{i^4}{10} \ge \sum_{i=\frac{n}{2}}^{n} \frac{\frac{n^4}{2}}{10} = \frac{\frac{n^4}{2}}{10} \cdot \frac{n}{2} = \frac{n^5}{320}$$
When  $C = \frac{1}{320}$ ,  $\sum_{i=\frac{n}{2}}^{n} \frac{i^4}{10} = \frac{n^5}{320} = C \cdot g(n) = \frac{n^5}{320}$ 

Then to prove 
$$\sum_{i=1}^{n} \frac{i^4}{10} = \Omega(n^5)$$

$$\sum_{i=\frac{n}{2}}^{n} \frac{i^4}{10} \ge \sum_{i=\frac{n}{2}}^{n} \frac{\frac{n}{2}^4}{10} = \frac{\frac{n}{2}^4}{10} \cdot \frac{n}{2} = \frac{n^5}{320}$$

When 
$$C = \frac{1}{320}$$
,  $\sum_{i=\frac{n}{2}}^{n} \frac{i^4}{10} = \frac{n^5}{320} = C \cdot g(n) = \frac{n^5}{320}$ 

So 
$$\sum_{i=1}^{n} \frac{i^4}{10} \ge \frac{1}{320} n^5$$

$$\sum_{i=1}^{n} \frac{i^4}{10} = \Omega(n^5)$$

So 
$$\sum_{i=1}^{n} \frac{i^4}{10} \ge \frac{1}{320} n^5$$
  
 $\sum_{i=1}^{n} \frac{i^4}{10} = \Omega(n^5)$   
So  $\sum_{i=1}^{n} \frac{i^4}{10} = \Theta(n^5)$ 

#### Part 3:

Sol:

$$\sum_{i=1}^{\log_2(n)} 4^i \le \sum_{i=1}^{\log_2(n)} 4^{\log_2(n)} = \frac{4^{\log_2(n)} - 1}{4 - 1} = \frac{n^2 - 1}{3} \le n^2$$

So 
$$\sum_{i=1}^{\log_2(n)} 4^i = O(n^2)$$

Then to prove 
$$\sum_{i=1}^{\log_2(n)} 4^i = \Omega(n^2)$$

$$\sum_{i=1}^{\log_2(n)} 4^i = \sum_{i=1}^{\log_2(n)-1} 4^i + 4^{\log_2(n)} = \sum_{i=1}^{\log_2(n)-1} 4^i + n^2$$

Then to prove 
$$\sum_{i=1}^{log_2(n)} 4^i = \Omega(n^2)$$
  
 $\sum_{i=1}^{log_2(n)} 4^i = \sum_{i=1}^{log_2(n)-1} 4^i + 4^{log_2(n)} = \sum_{i=1}^{log_2(n)-1} 4^i + n^2$   
Since  $\sum_{i=1}^{log_2(n)-1} 4^i > 0$ ,  $\sum_{i=1}^{log_2(n)} 4^i \ge n^2$ , so  $\sum_{i=1}^{log_2(n)} 4^i = \Omega(n^2)$ 

So 
$$\sum_{i=1}^{\log_2(n)} 4^i = \Theta(n^2)$$

```
Problem 3:
Part 1:
Sol:
The pseudocode for Closest Pair is:
closestPair (A)
    quicksort(A, 0, A. length - 1) //sort the array first
    dif = |A[0] - A[1]|
    index = 0
    for i = 0 to A. length -2
        if |A[i] - A[i+1]| < dif
             dif = |A[i] - A[i+1]|
             index = i
    output A[index], A[index+1]
quicksort (A, lo, hi)
    if lo < hi
        p = partition(A, lo, hi)
        quicksort(A, lo, p - 1)
        quicksort(A, p + 1, hi)
partition (A, lo, hi)
    pivot = A[hi]
                                  //place for swapping
    i = lo
    for j = lo to hi - 1
        if A[j] <= pivot
            swap A[i] with A[j]
             i = i + 1
    swap A[i] with A[hi]
    return i
```

```
More space for Problem 3:
Part 2:
Sol:
The pseudocode for Remove Duplicates is :
removeDuplicates (A)
    quicksort (A, 0, A. length -1) //sort the array first
    output A[0]
    for i = 1 to A. length -1
         if A[i] != A[i-1]
             output A[i]
quicksort (A, lo, hi)
    if lo < hi
        p = partition (A, lo, hi)
         quicksort(A, lo, p - 1)
         quicksort(A, p + 1, hi)
partition (A, lo, hi)
    pivot = A[hi]
                                   //place for swapping
    i = lo
    for j = lo to hi - 1
        if A[j] <= pivot</pre>
             swap A[i] with A[j]
             i = i + 1
    swap A[i] with A[hi]
    return i
```

#### Problem 4:

Sol:

Obviously the total running time for the algorithm is 
$$\sum_{i,j>i} (j-i)$$
. First, to prove that  $\sum_{i,j>i} (j-i) = O(n^3)$ : 
$$\sum_{i,j>i} (j-i) = \sum_{i=0}^n (\sum_{j=i}^n (j-i)) = \sum_{i=0}^n (i+(i-1)+(i-2)+\cdots+1+0)$$
  $\leq \sum_{i=0}^n (i+i+i+\cdots+i+i) = \sum_{i=0}^n i^2 \leq \sum_{i=0}^n n^2 = n^3$  So  $\sum_{i=1}^n \frac{i(i+1)}{2} \leq n^3$ , so  $\sum_{i,j>i} (j-i) = O(n^3)$ .

Second, to prove that  $\sum_{i,j>i} (j-i) = \Omega(n^3)$ :

$$\sum_{i,j>i} (j-i) = \sum_{i=0}^{n} (\sum_{j=i}^{n} (j-i)) = \sum_{i=0}^{n} (i+(i-1)+(i-2)+\cdots+1+0) = \sum_{i=0}^{n} \frac{i(i+1)}{2}$$

$$\geq \sum_{i=0}^{n} \frac{i^{2}}{2}$$
Consider the last  $\frac{n}{2}$  elements in that polynomial we get:

$$\sum_{i=\frac{n}{2}}^{n} \frac{i^2}{2} \ge \sum_{i=\frac{n}{2}}^{n} \frac{\frac{n^2}{2}}{2} = \sum_{i=\frac{n}{2}}^{n} \frac{n^2}{8} = \frac{n}{2} \cdot \frac{n^2}{8} = \frac{n^3}{16}$$

 $\sum_{i=\frac{n}{2}}^{n} \frac{i^2}{2} \ge \sum_{i=\frac{n}{2}}^{n} \frac{\frac{n^2}{2}}{2} = \sum_{i=\frac{n}{2}}^{n} \frac{n^2}{8} = \frac{n}{2} \cdot \frac{n^2}{8} = \frac{n^3}{16}$ So when C = 16, we have  $C \cdot \sum_{i,j>i} (j-i) \ge n^3$ , so  $\sum_{i,j>i} (j-i) = \Omega(n^3)$ 

So 
$$\sum_{i,j>i} (j-i) = \Theta(n^3)$$
